

1. Photosynthesis is the process by which green plants use sunlight, carbon dioxide and water to make their food.

It produces glucose and oxygen.

It is important because plants get their food from this process and oxygen is also released into the atmosphere.

2. Evaporation is the process in which a liquid changes into a gas from its surface.

For example, wet clothes dry when they are kept in the sun.

The water present in the clothes slowly evaporates.

3. Newton's First Law states that an object remains at rest or keeps moving with constant speed in a straight line unless an external force acts on it.

For example, a book kept on a table will

remain at rest until someone moves it.

4. The human heart pumps blood to all parts of the body.

It supplies oxygen and nutrients to the cells and also helps in carrying waste products away from the body.

5. Renewable energy sources are those which can be naturally replenished.

Examples are solar energy and wind energy.

Non-renewable sources are limited and cannot be replaced quickly.

Examples are coal and petroleum.

6. Average speed = Distance $\div$ Time

$$= 180 \div 3$$

$$= 60 \text{ km/h}$$

Therefore, the average speed of the car is ****60 km/h****.

7. Ice floats on water because ice is less dense than liquid water.

When water freezes, its molecules form an open structure.

Because of this, the volume increases and its density becomes lower than that of water.

8. (a) Chlorophyll is the green pigment present in plant cells.

It absorbs light energy which is needed for photosynthesis.

(b) Sunlight provides the energy required by plants to carry out photosynthesis.

Without sunlight, photosynthesis cannot take place normally.

9. We see lightning before we hear thunder because light travels much faster than sound.

The light from the lightning reaches our eyes almost immediately, while the sound takes more time to reach our ears.

10. Forests are very important for the environment.

They provide oxygen and absorb carbon dioxide.

They also prevent soil erosion and provide shelter to many animals and birds.

Forests help in maintaining the climate and also support the water cycle.
